

UMAP overview of all-gene clustering for each species (Leiden resolution 1.0).

UMAP overview of all-gene clustering for each species (Leiden resolution 1.0).

Figure 1 displays two heatmaps showing the spatial distribution of 1500 genes across the leaf primordia of *Arabidopsis thaliana*. The left heatmap is labeled "Wolfe et al." and the right heatmap is labeled "Wolfe et al.". Both heatmaps show gene expression patterns across a grid of 1500 genes (y-axis) and 1500 genes (x-axis). The color scale ranges from 0.00 (white) to 0.05 (black). The heatmaps show distinct clusters of genes with similar expression patterns, indicating functional modules or pathways. The "Wolfe et al." heatmap shows a more complex pattern of gene expression compared to the "Wolfe et al." heatmap.

Figure 1 displays two scatter plots illustrating the relationship between sample id and lesion_id. The left plot, labeled 'lesion_id' on the x-axis and 'sample_id' on the y-axis, shows a dense cloud of points with a small cluster of points at the bottom left. The right plot, labeled 'sample_id' on the x-axis and 'lesion_id' on the y-axis, shows a dense cloud of points with a small cluster of points at the bottom right. Both plots have axes ranging from 0 to 100. The left plot is labeled 'lesion_id' and the right plot is labeled 'sample_id'.

Figure 1 displays two t-SNE plots comparing single-cell transcriptomic data. The left plot, labeled 'leiden_1_0', shows cells colored by cluster, with a legend on the left listing clusters 0-17 and their corresponding colors. The right plot, labeled 'sample_id', shows cells colored by sample, with a legend on the right listing sample IDs and their corresponding colors. Both plots show a similar distribution of cell clusters, indicating that the clustering is robust to sample-specific effects.

Figure 2 displays t-SNE plots showing cell clusters and their corresponding marker genes. The figure is divided into three panels: leiden_0 (left), sample_id (middle), and a combined view (right). Each panel shows a t-SNE plot with cells colored by cluster. The leiden_0 panel shows 17 clusters, the sample_id panel shows 34 clusters, and the combined view shows 34 clusters. The combined view also includes a list of marker genes for each cluster, such as SRR12619660, SRR15686119, SRR121124421, etc.

The figure displays two UMAP plots side-by-side, illustrating the relationship between sample identity and Leiden clustering results.

Left Plot: leiden_1_0

- X-axis:** UMAP1
- Y-axis:** UMAP2
- Legend:** Clusters are colored by Leiden ID (0 to 13).

Right Plot: sample_id

- X-axis:** UMAP1
- Y-axis:** UMAP2
- Legend:** Clusters are colored by sample ID (CRR719610 to SRR28006713).

Figure 2 displays two t-SNE plots of single-cell transcriptomic data. The left plot is labeled 'leiden_1_0' and the right plot is labeled 'sample_id'. Both plots show cell clusters colored by sample ID. A legend on the right lists 24 sample IDs with corresponding colored dots. The plots show that cells from the same sample cluster together, indicating high within-sample similarity.
