

Ligand-receptor interaction summaries for each species.

Figure 2 is a dot plot showing the magnitude of rank for 12 ligand-receptor pairs across 12 source-target cancer transitions. The y-axis lists the ligand-receptor pairs, and the x-axis lists the source-target transitions. The size of the dots represents the specificity rank (0.25, 0.50, 0.75), and the color represents the magnitude rank (0.00 to 0.05). The plot shows that the magnitude of rank is generally higher for the endodermis and endodermis transitions compared to the other transitions.

Figure 2 is a dot plot showing the magnitude of rank change for 15 ligand-receptor pairs across 15 source-target transitions. The y-axis lists the ligand-receptor pairs, and the x-axis lists the source-target transitions. The size of the dots represents the specificity rank (0.25, 0.50, 0.75), and the color represents the magnitude rank (0.00 to 0.04). The transitions are: root hair, root hair, root hair, trichome, trichome, trichome, trichome, Ambigous, Ambigous, root, xylem, root, root hair, root hair, Ambigous, root hair, xylem.

Figure 3 is a dot plot showing the magnitude and specificity of ligand-receptor interactions. The y-axis lists 12 ligand-receptor pairs (e.g., g22080 → g05010). The x-axis lists 12 source-target pairs (e.g., guard cell → guard cell). The plot uses colored dots to represent the magnitude rank (0.00 to 1.00) and grey dots to represent the specificity rank (0.25, 0.50, 0.75).

Figure 2 is a dot plot showing the specificity of the 1000 most specific ligand-receptor pairs. The y-axis lists 10 ligand-receptor pairs (e.g., 4HG0381750 -> 1HG0069750). The x-axis lists 10 source-target pairs (e.g., Unknown -> Unknown, Unknown -> mitochondrial, etc.). The size of the dots represents the specificity rank (0.25, 0.50, 0.75), and the color represents the magnitude rank (0.00 to 0.03).

Figure 2 is a scatter plot showing the relationship between Source and Target cell types for various ligand-receptor pairs. The x-axis represents the Source cell type, and the y-axis represents the Target cell type. The size of the dots indicates the Specificity rank (0.25 to 0.75), and the color indicates the Magnitude rank (0.00 to 0.05). The plot shows that many ligand-receptor pairs have a high specificity rank (large dots) and a high magnitude rank (dark colors).

Figure 2 is a dot plot showing the magnitude of rank for 12 ligand-receptor pairs. The y-axis lists the pairs, and the x-axis lists the source and target proteins. The size of the dots represents the specificity rank (0.75, 0.50, 0.25), and the color represents the magnitude rank (0.000 to 0.005).

The y-axis labels are:

- Bra020155 → Bra020155
- Bra004545 → Bra020013
- Bra035593 → Bra0112836
- Bra026580 → Bra020155
- Bra035593 → Bra000214
- Bra035593 → Bra006595
- Bra035599 → Bra020155
- Bra026346 → Bra036229
- Bra028924 → Bra000214
- Bra028924 → Bra020155
- Bra035593 → Bra000214
- Bra035593 → Bra020155

The x-axis labels are:

- bundle sheath → bundle sheath
- bundle sheath → bundle sheath
- procambium → procambium
- procambium → procambium
- procambium → procambium
- procambium → procambium
- procambium → procambium
- procambium → procambium
- procambium → procambium
- procambium → procambium
- procambium → procambium
- procambium → procambium

The legend indicates:

- Magnitude rank: 0.005 (dark blue), 0.003 (light blue), 0.000 (yellow).
- Specificity rank: 0.75 (large dot), 0.50 (medium dot), 0.25 (small dot).

[illegible]

Figure 2 is a dot plot showing the magnitude of rank for 12 ligand-receptor pairs across 12 source-target combinations. The y-axis lists ligand-receptor pairs (e.g., 010G079100 → 009G080400). The x-axis lists source-target combinations (e.g., solute:embryo → embryo). Dot size indicates specificity rank (0.25, 0.50, 0.75) and dot color indicates magnitude rank (0.00 to 0.02).

Figure 1 is a dot plot showing the magnitude of ligand-receptor interactions. The y-axis lists 12 ligand-receptor pairs, and the x-axis lists 12 source-target pairs. The color of the dots represents the magnitude rank, ranging from 0.00 (blue) to 0.02 (red). The size of the dots represents the specificity rank, with sizes corresponding to 0.75, 0.50, and 0.25. A color scale for magnitude rank is shown on the right, and a size legend for specificity rank is shown below the plot.

Figure 2 is a dot plot showing the specificity rank of ligand-receptor pairs. The y-axis lists 15 ligand-receptor pairs, and the x-axis lists 15 source-target cell type pairs. The size of the dots represents the specificity rank (0.25, 0.50, 0.75), and the color represents the magnitude rank (0.00 to 0.72).

Figure 2 is a dot plot showing the magnitude of the Spearman correlation coefficient between the specificity rank of the source and target ligands. The y-axis lists 16 ligand pairs (Source → Target). The x-axis lists 16 ligand types: procanium, incanum, repcanum, incanum, repcanum, procanium, incanum, repcanum, procanium, incanum, repcanum, procanium, incanum, repcanum, procanium, and pericycle. The color of the dots represents the magnitude of the correlation coefficient, ranging from 0.00 (yellow) to 0.02 (dark blue). The size of the dots represents the specificity rank, with three sizes corresponding to ranks 0.75, 0.50, and 0.25. A legend on the right shows the color scale for magnitude and the size scale for specificity rank.

Figure 2 is a dot plot showing the magnitude of the rank of the ligand-receptor interaction (Y-axis) versus the specificity rank (X-axis). The Y-axis lists 12 ligand-receptor pairs, and the X-axis lists 12 source-target pairs. The magnitude of the rank is indicated by the size of the dot, and the specificity rank is indicated by the color of the dot. A color scale on the right shows the magnitude of the rank from 0.00 (blue) to 0.21 (red). A size scale on the right shows the specificity rank from 0.25 (large) to 0.75 (small).

Specificity rank: 0.75, 0.50, 0.25

Figure 2 is a dot plot showing the magnitude rank of 15 receptor-ligand pairs. The y-axis lists the receptor-ligand pairs, and the x-axis lists the source and target proteins. The color of the dots represents the magnitude rank, with a scale from 0.000 (yellow) to 0.010 (dark purple). The size of the dots represents the specificity rank, with a scale from 0.25 (small) to 0.75 (large).
